

Appl. No. 09/822,906  
Amd. Dated January 3, 2005  
Reply to Office Action of October 7, 2004

**Amendments to the Claims:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

**Listing of Claims:**

Claim 1 (currently amended): A method of operating a subscriber unit to request access to a common transmission medium, said method comprising:

receiving an exclusive assignment to a toneset within an OFDM burst structure; and  
transmitting an OFDM burst using tones specified by said exclusive assignment while leaving other tones in said OFDM burst available for use by other subscriber units, {[; and]}  
wherein said OFDM burst comprises an access request burst.

Claim 2 (original): The method of claim 1 further comprising:

converting said OFDM burst into the time domain prior to transmitting said OFDM burst.

Claim 3 (original): The method of claim 1 wherein transmitting said OFDM burst signals termination of a silent period in a voice call.

Claim 4 (original): The method of claim 1 wherein transmitting said OFDM burst comprises transmitting said burst in a time slot determined by a DOCSIS MAC layer protocol.

Claim 5 (original): A method of operating a central access point to control access to a common transmission medium, said method comprising:

sending an exclusive assignment to a toneset within an OFDM burst structure to a selected subscriber unit;

receiving an access request OFDM burst that includes said toneset as transmitted from said selected subscriber unit; and

in response to said access request OFDM burst, assigning at least one time slot to said selected subscriber unit for use of said common transmission medium.

Appl. No. 09/822,906  
Am'd. Dated January 3, 2005  
Reply to Office Action of October 7, 2004

Claim 6 (original): The method of claim 5 wherein said access request OFDM burst includes access request information from subscriber units other than said selected subscriber unit.

Claim 7 (original): The method of claim 6 wherein said toneset transmitted from said selected subscriber unit signals an end to a silent period in a voice call.

Claim 8 (original): The method of claim 5 wherein receiving said access request OFDM burst comprises receiving said access request burst within a time slot determined by a DOCSIS MAC layer protocol.

Claim 9 (original): Apparatus for operating a subscriber unit to request access to a common transmission medium, said apparatus comprising:

a MAC layer processor that receives an exclusive assignment to a toneset within an OFDM burst structure; and  
an access request burst formation block that transmits an OFDM burst using tones specified by said assignment while leaving other tones in said OFDM burst available for use by other subscriber units; and wherein  
said OFDM burst comprises an access request OFDM burst.

Claim 10 (original): The apparatus of claim 9 further comprising:  
a transform block that converts said OFDM burst into the time domain.

Claim 11 (original): The apparatus of claim 9 wherein transmitting said OFDM burst signals termination of a silent period in a voice call.

Claim 12 (original): The apparatus of claim 9 wherein said access request burst formation block transmits said OFDM burst in an exclusively reserved time slot determined by a DOCSIS MAC layer protocol.

Appl. No. 09/822,906  
Amd. Dated January 3, 2005  
Reply to Office Action of October 7, 2004

Claim 13 (original): Apparatus for operating a central access point to control access to a common transmission medium, said apparatus comprising:

a MAC layer processor that sends an exclusive assignment to a toneset within an OFDM burst structure to a selected subscriber unit; and

a request access processor that receives an access request OFDM burst that includes said toneset as transmitted from said selected subscriber unit; and

wherein in response to said access request OFDM burst, said MAC layer processor assigns at least one time slot to said selected subscriber unit for use of said common transmission medium.

Claim 14 (original): The apparatus of claim 13 wherein said access request OFDM burst includes access request information from subscriber units other than said selected subscriber unit.

Claim 15 (original): The apparatus of claim 14 wherein said toneset transmitted from said selected subscriber unit signals an end to a silent period in a voice call.

Claim 16 (original): The apparatus of claim 13 wherein said request access processor receives said access request OFDM burst within a time slot determined by a DOCSIS MAC layer protocol.

Claim 17 (original): Apparatus for operating a subscriber unit to request access to a common transmission medium, said apparatus comprising:

means for receiving an exclusive assignment to a toneset within an OFDM burst structure;

means for transmitting an OFDM burst using tones specified by said assignment while leaving other tones in said OFDM burst available for use by other subscriber units; and wherein said burst comprises an access request burst.

Appl. No. 09/822,906  
Am'd. Dated January 3, 2005  
Reply to Office Action of October 7, 2004

Claim 18 (original): Apparatus for operating a central access point to control access to a common transmission medium, said apparatus comprising:

means for sending an exclusive assignment to a toneset within an OFDM burst structure to a selected subscriber unit;

means for receiving an access request OFDM burst that includes said toneset as transmitted from said selected subscriber unit; and

means for, in response to said access request OFDM burst, assigning at least one time slot to said selected subscriber unit for use of said common transmission medium.

Claim 19 (currently amended): A computer program product for operating a subscriber unit to request access to a common transmission medium, said product comprising:

code that causes reception and processing of an exclusive assignment to a toneset within a burst structure;

code that causes transmission of an OFDM burst using tones specified by said assignment while leaving other tones in said OFDM burst available for use by other subscriber units; and

a computer-readable storage medium that stores the codes, [(; and)] wherein said burst comprises an access request burst.

Claim 20 (original): A computer program product for operating a central access point to control access to a common transmission medium, said product comprising:

code that causes transmission of an exclusive assignment to a toneset within an OFDM burst structure to a selected subscriber unit;

code that causes reception of an access request OFDM burst that includes said toneset as transmitted from said selected subscriber unit;

code that causes assignment of at least one time slot to said selected subscriber unit for use of said common transmission medium; and

a computer-readable storage medium that stores the codes.
